

HBV Resource List

Email & General Website Posts

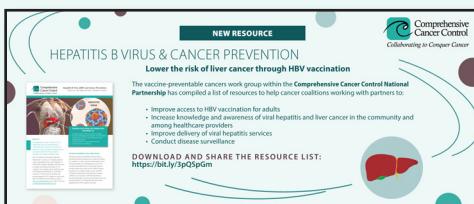

LISTSERVS/E-NEWSLETTERS

Many liver cancer cases are related to the hepatitis B virus (HBV). The hepatitis B vaccine is safe and effective against HBV, can lower liver cancer risk, and is recommended for all infants, unvaccinated children, and some groups of unvaccinated adults at higher risk of infection. The vaccine-preventable cancers work group within the Comprehensive Cancer Control National Partnership has compiled a list of resources to help cancer coalitions working with partners to:

- Improve access to HBV vaccination for adults
- Increase knowledge and awareness of viral hepatitis and liver cancer in the community and among healthcare providers
- Improve delivery of viral hepatitis services
- Conduct disease surveillance

Download and share the resource list with your coalition members to enhance your liver cancer prevention work today: <https://bit.ly/3pQSpGm>
